Also, HRR25 operates promote repair of DNA strand breaks at a specific nucleotide sequent and is the only protein kinase known to have such recombination/repair promoting activity. Recombinant HRR25-like proteins and host cells expressing them are useful in screening methods designed to examine the effects of various compositions on DNA break repair and protein kinase activities of the protein. The HRR25-like proteins are casein kinase class I protein kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1233

                        This human casein-kinase-I (CKI-gamma-2Hu) gene which is a homolog of a DNA recombination and repair gene called HRR25 (HO and/or radiation repair) possesses both protein-tyrosine-kinase and protein serine/tyrosine-kinase activities. HRR25 operates to promote repair of DNA strand breaks at a specific nucleotide sequence and is the only protein-kinase known to have such recombination/repair promoting activity. DNA encoding HRR25 can be used to isolate and identify related sequences, while recombinant HRR25, or cells expressing it, can be used to screen compounds for their effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1003

      The present invention describes a library of human polynucleotides CC comprising the sequences given in AAZ12532 to AAZ1779. Also described is CC a method of detecting differentially expressed genes correlated with the CC cancerous state of a mammalian cell, comprising detecting at least one CC differentially expressed gene product in a test sample from a cell CC suspected of being cancerous, where the gene product is encoded by one CC of the 5248 polynucleotide sequences given in AAZ12532 to AAZ1779. The CC polynucleotides can be used as a source of primers and probes, which can CC mapping, tissue typing or profiling, forensics, genetic analysis and CC can be used for raising antibodies for experimental, diagnostic and CC can be used for raising antibodies for experimental, diagnostic and CC carrays for diagnostics (which may be used to determine function of an CC carrays for diagnostics (which may be used to determine function of an CC concer); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to cidentify a genetic predisposition or susceptibility to a disease such as CC cancer). The polynucleotides of the invention are especially used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ωy

The invent useful in developmental biology and in elucidating cell signalling cell-icell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published pet sequence.

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ12532 to AAZ1779. Also described a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AAZ12532 to AAZ17779. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC polynucleotides can be used as a source of primers and probes, which can CC be used for a variety of purpose, e.g. detection of expression levels, CC mapping, tissue typing or profiling, forensics, genetic analysis and CC detection of polymorphisms. Polypeptides encoded by the polynucleotides CC can be used for raising antibodies for experimental, diagnostic and CC therapeutic purposes. The polynucleotides may also be used to construct CC arrays for diagnostics (which may be used to determine function of an CC encoded protein); and to detect differences in expression levels between CC two cells (e.g. to identify abnormal or diseased tissue in a human, to CC identify a genetic predisposition or susceptibility to a disease such as CC cancer). The polynucleotides of the invention are especially used in the CC diagnosis, prognosis and management of colorectal cancer, breast cancer, CC and lung cancer. The polynucleotides can also be used to screen for CC peptide analogues and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

CC a method of detecting differentially expressed genes correlated with the C cancerous state of a mammalian cell, comprising detecting at least one C differentially expressed gene product in a test sample from a cell CC suspected of being cancerous, where the gene product is encoded by one CC of the 5248 polynucleotide sequences given in AR212532 to AR217779. The CC polynucleotides can be used as a given in AR212532 to AR217779. The CC polynucleotides can be used for a variety of purpose, e.g. detection of expression levels, CC mapping, tissue typing or profiling, forensics, genetic analysis and CC detection of polymorphisms. Polypeptides encoded by the polynucleotides CC can be used for raising antibodies for experimental, diagnostic and CC therapeutic purposes. The polynucleotides may also be used to construct a arrays for diagnostics (which may be used to determine function of an CC concepting and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to CC identify a genetic predisposition or susceptibility to a disease such as CC cancer). The polynucleotides of the invention are especially used in the CC diagnosis, prognosis and management of colorectal cancer, breast cancer, CC paptide analogues and antagnists
peptide analogues and antagonists.
